Question	Answer
1. What is the primary function of the cell membrane?	The primary function of the cell membrane is to regulate the movement of substances in and out of the cell, maintaining the cell's internal environment.
2. How does the cell membrane maintain its structure?	The cell membrane maintains its structure through the phospholipid bilayer, where hydrophilic heads face outward and hydrophobic tails face inward.
3. What is the role of cholesterol in the cell membrane?	Cholesterol is embedded in the phospholipid bilayer, providing structural stability and fluidity to the membrane.
4. How do proteins facilitate transport across the membrane?	Proteins, such as transporters and channels, facilitate the movement of specific molecules and ions across the membrane.
5. What is the significance of the cell membrane's fluidity?	The fluidity of the cell membrane allows for the movement of proteins and lipids, which is essential for various cellular processes.
